PROFESSIONAL SUMMARY

Senior Software Engineer with 5+ years building cloud-native applications, platform infrastructure, and distributed systems across AWS and GCP. Known for reducing operational overhead, shipping reliable production systems, and turning complex infrastructure problems into clean, maintainable solutions.

PROFESSIONAL EXPERIENCE

Cargill, Incorporated · Senior Software Engineer Nov 2024 – Present

Cut infrastructure provisioning time by 90% by designing reusable Terraform modules and automated deployment pipelines adopted across multi-account AWS environments.

Shipped observability and incident-response tooling (OpenTelemetry, Prometheus, Grafana, Datadog) that drove mean response times below 2 minutes for production incidents.

Built internal developer platform tooling that improved deployment consistency and reduced manual toil across Kubernetes workloads and distributed services.

Amazon Web Services · Solutions Architect Jul 2022 – Apr 2023

Delivered cloud-native architectures for customers using EC2, Lambda, S3, RDS, and API-driven serverless patterns, translating business requirements into scalable designs.

Authored Python and JavaScript automation solutions that measurably improved customer operational efficiency and reduced deployment friction.

Directly influenced customer adoption decisions by presenting technical solutions and optimized architectures to engineering and executive stakeholders.

Amazon Web Services · Software Development Engineer Intern May 2021 – Aug 2021

Built and fully documented a scalable serverless chatbot platform on AWS Lambda, API Gateway, and DynamoDB that became a reusable foundation for future team projects.

Delivered production-ready code within an Agile team environment, earning a return offer through consistent performance and initiative.

PROJECTS

Orbit — Interactive Portfolio Platform

Challenge: Static portfolio sites felt lifeless — I built a 3D interactive globe that plots geographic life events and milestones as a personal portfolio, then tackled the harder problem of turning it into a multi-tenant platform so anyone could generate their own globe, hosted on a custom domain, in minutes.

Architected the full provisioning pipeline — user input to live custom-domain deployment — giving recruiters and job seekers a shareable, memorable alternative to a PDF resume.

BG Strip — AI Background Remover

Challenge: Most background removal tools require uploading images to a server, raising privacy concerns and adding latency — so I built a fully client-side solution that runs an ONNX segmentation model entirely in the browser with zero uploads.

Shipped a graceful offline fallback mode with a tolerance-based flood-fill canvas eraser when the CDN model is unavailable, ensuring the tool works in any network condition.

TECHNICAL SKILLS

Languages: Python, Go, Rust, JavaScript, Java, SQL, Bash **Cloud & Infra:** AWS, GCP, Kubernetes, Docker, Terraform, Helm, Ansible

Observability: Prometheus, Grafana, Datadog, OpenTelemetry, CloudWatch CI/CD: GitHub Actions, GitLab CI, Jenkins Databases: MySQL, RDS, Cloud SQL, Spanner

EDUCATION & CERTIFICATION

Emory University — B.S. Computer Science 2022

AWS Certified Solutions Architect – Associate
